FIG. 2

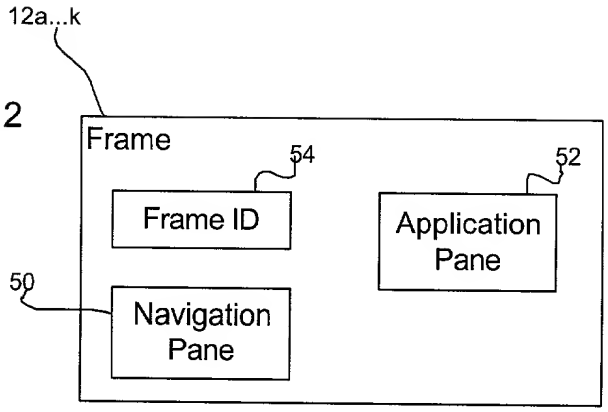

FIG. 3

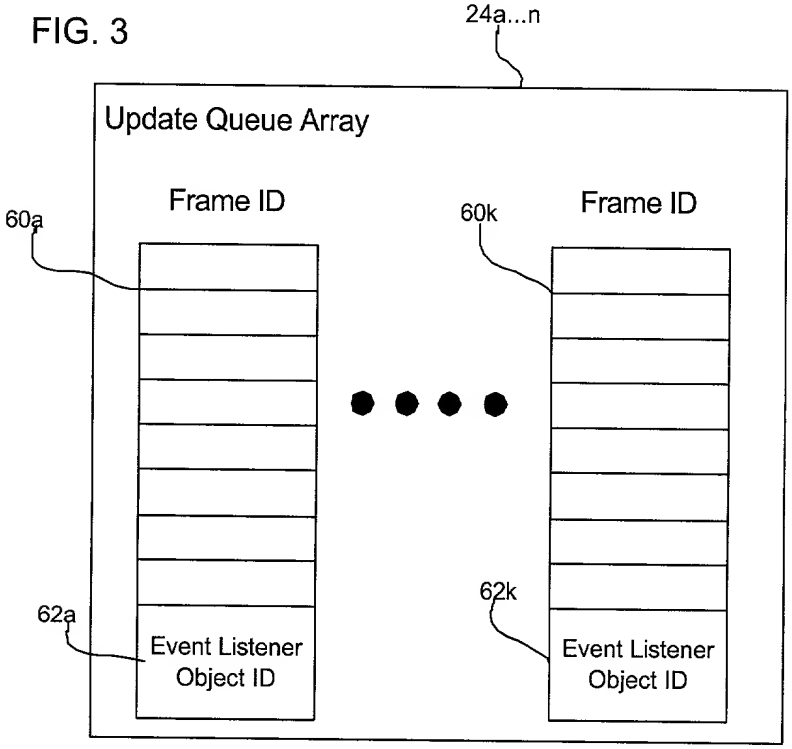

FIG. 4

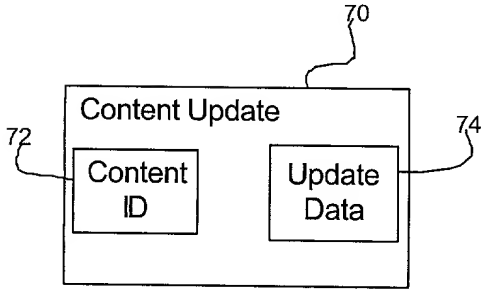

FIG. 5

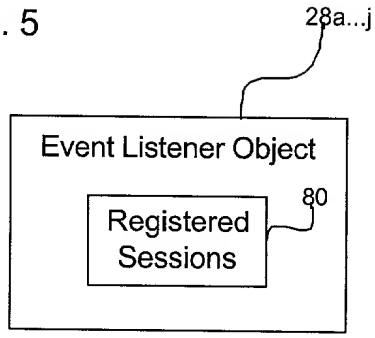

FIG. 6

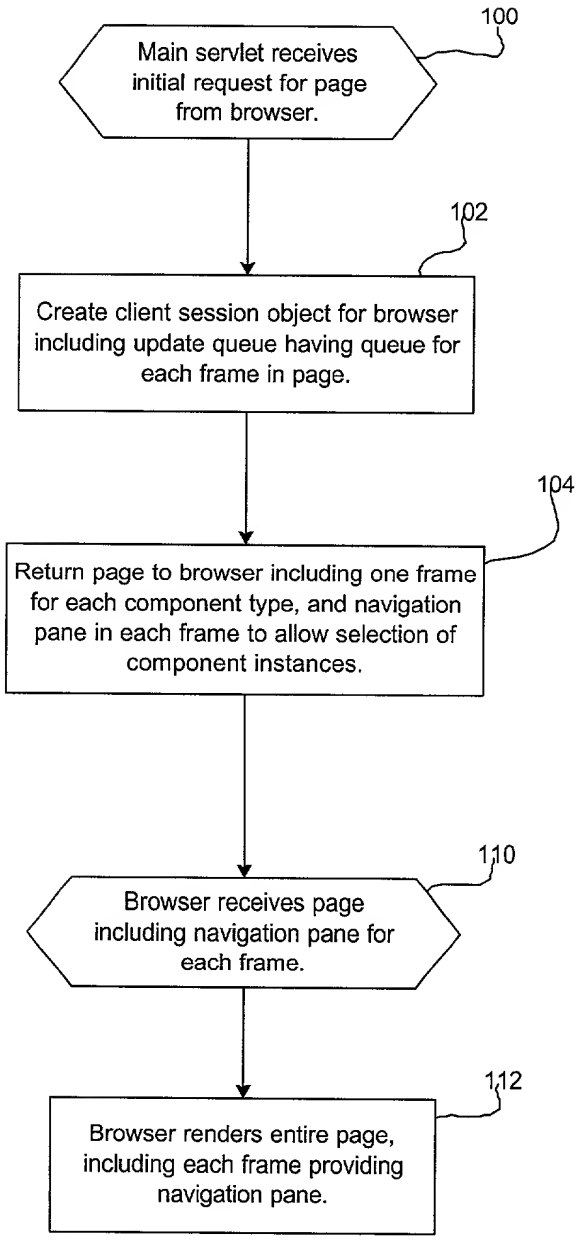
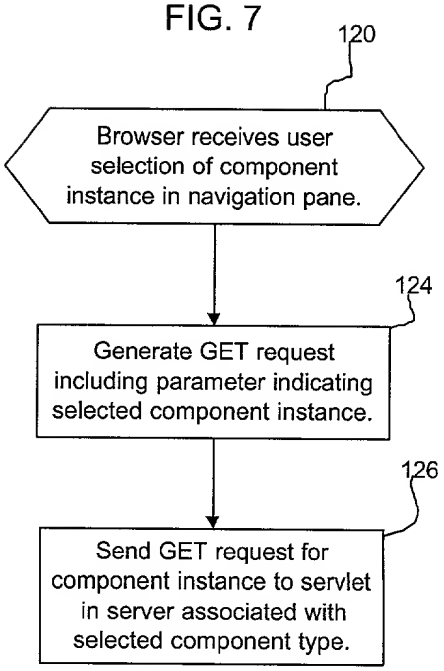


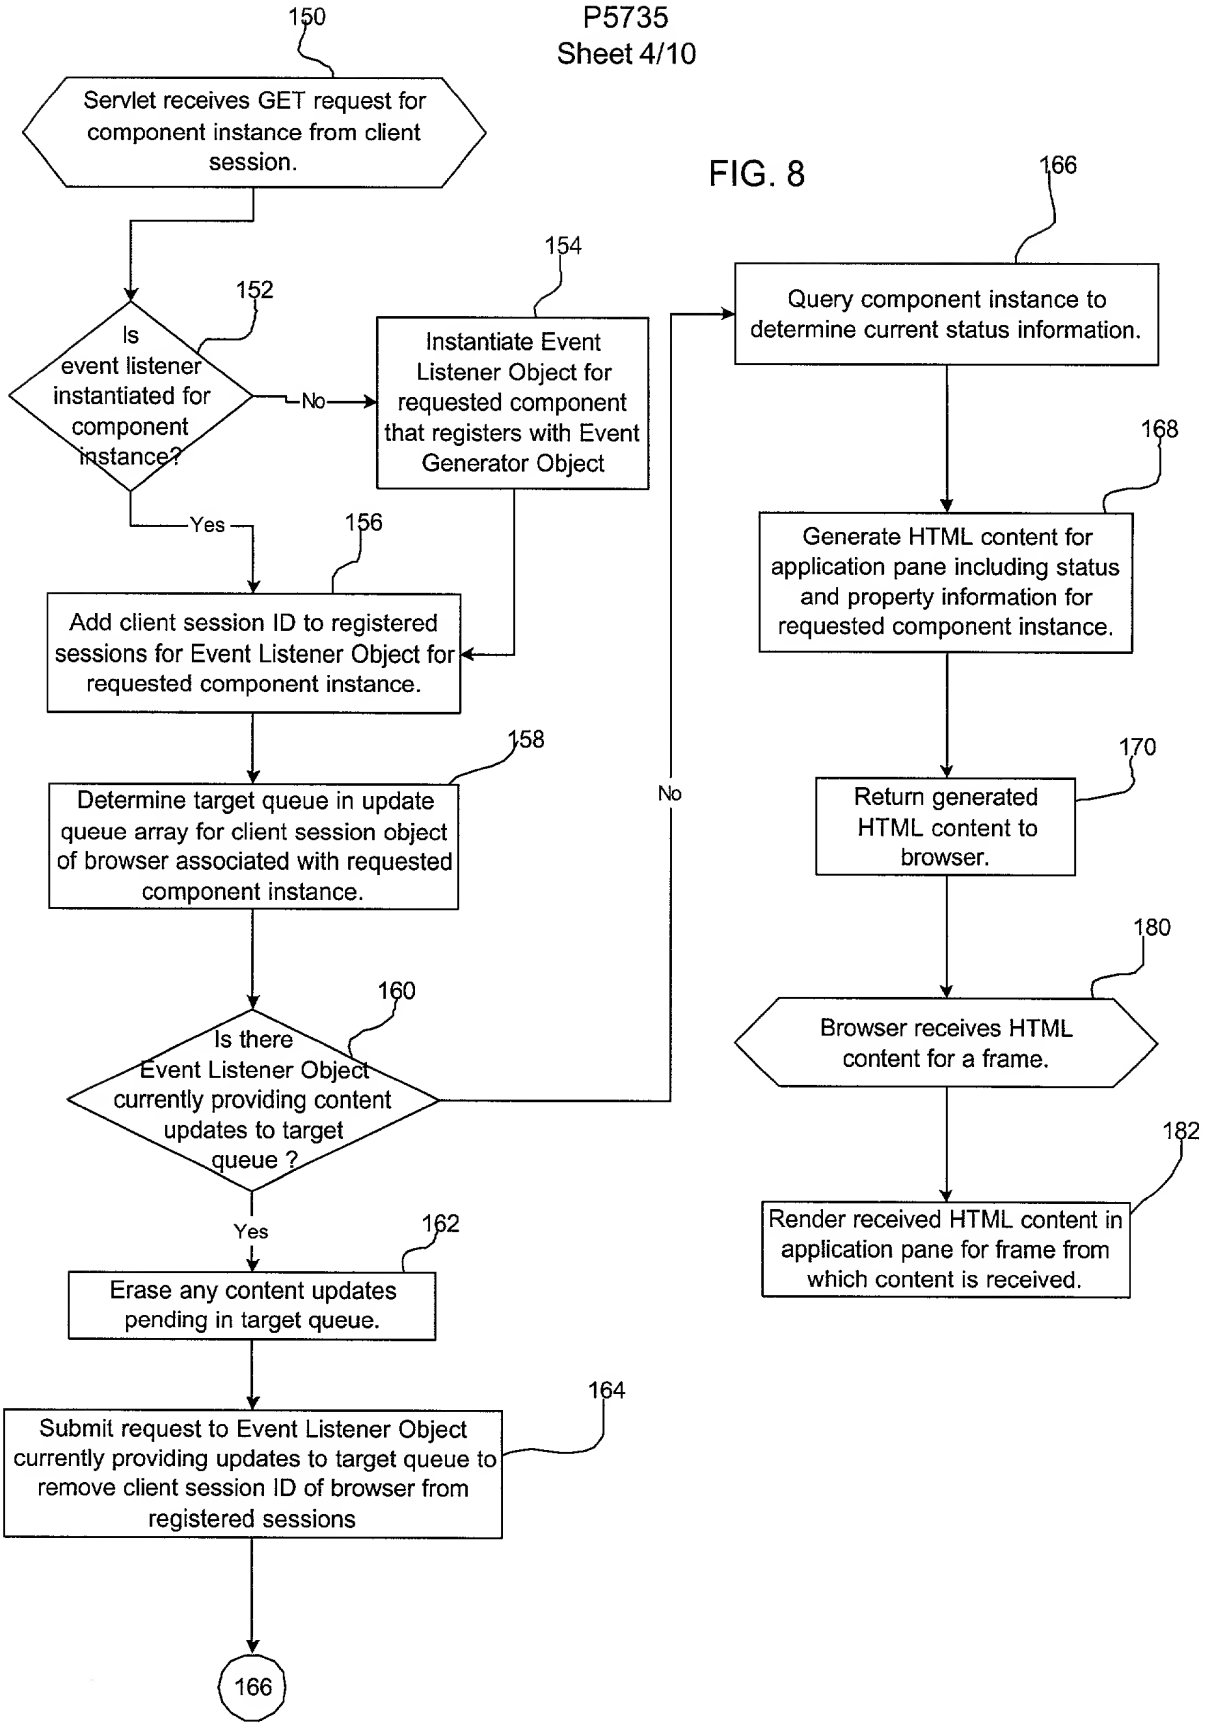
100
Main servlet receives initial request for page from browser.
102
Create client session object for browser including update queue having queue for each frame in page.
104
Return page to browser including one frame for each component type, and navigation pane in each frame to allow selection of component instances.
110
Browser receives page including navigation pane for each frame.
112
Browser renders entire page, including each frame providing navigation pane.

FIG. 7

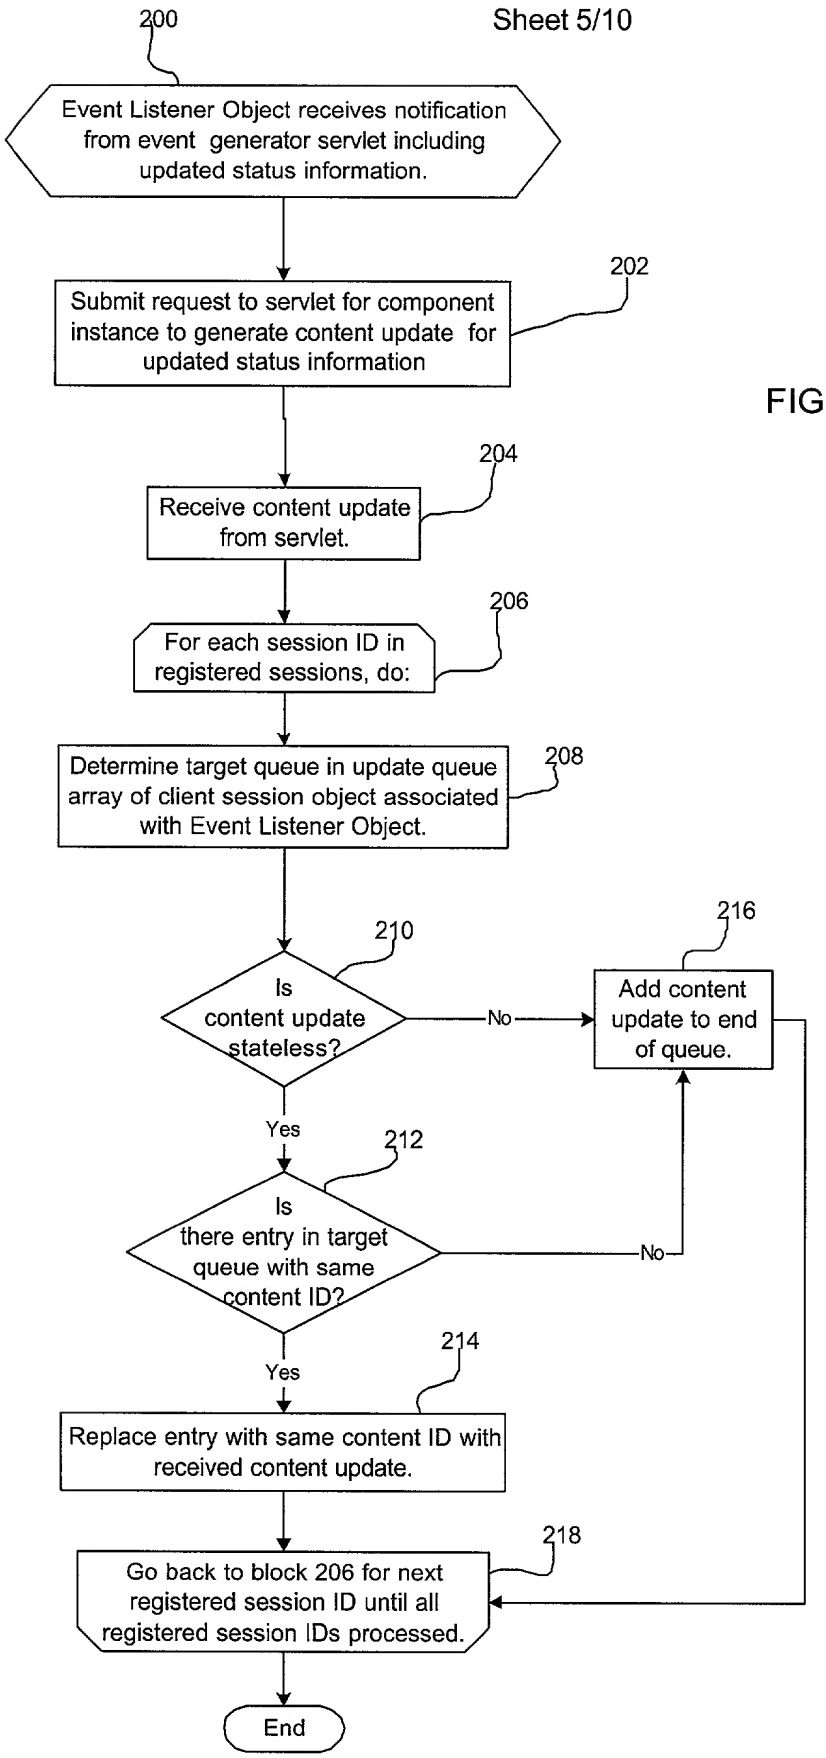


120
Browser receives user selection of component instance in navigation pane.
124
Generate GET request including parameter indicating selected component instance.
126
Send GET request for component instance to servlet in server associated with selected component type.

FIG. 8



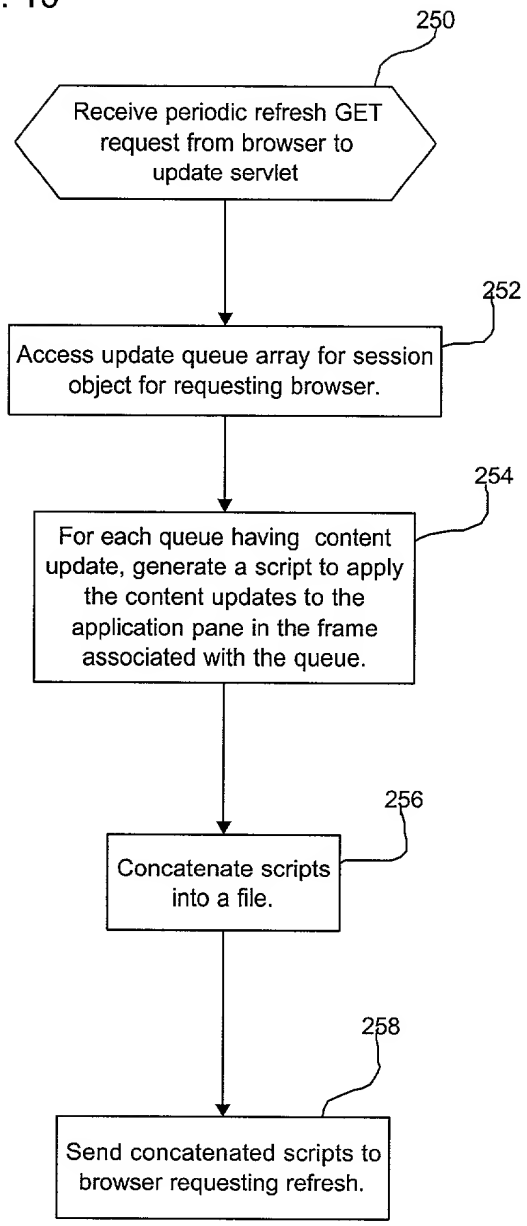
150
Servlet receives GET request for component instance from client session.
152
Is event listener instantiated for component instance?
No
Yes
154
Instantiate Event Listener Object for requested component that registers with Event Generator Object
156
Add client session ID to registered sessions for Event Listener Object for requested component instance.
158
Determine target queue in update queue array for client session object of browser associated with requested component instance.
160
Is there Event Listener Object currently providing content updates to target queue ?
No
Yes
162
Erase any content updates pending in target queue.
164
Submit request to Event Listener Object currently providing updates to target queue to remove client session ID of browser from registered sessions
166
166
Query component instance to determine current status information.
168
Generate HTML content for application pane including status and property information for requested component instance.
170
Return generated HTML content to browser.
180
Browser receives HTML content for a frame.
182
Render received HTML content in application pane for frame from which content is received.



200
Event Listener Object receives notification from event generator servlet including updated status information.
202
Submit request to servlet for component instance to generate content update for updated status information
204
Receive content update from servlet.
206
For each session ID in registered sessions, do:
208
Determine target queue in update queue array of client session object associated with Event Listener Object.
210
Is content update stateless?
No
216
Add content update to end of queue.
Yes
212
Is there entry in target queue with same content ID?
No
Yes
214
Replace entry with same content ID with received content update.
218
Go back to block 206 for next registered session ID until all registered session IDs processed.
End

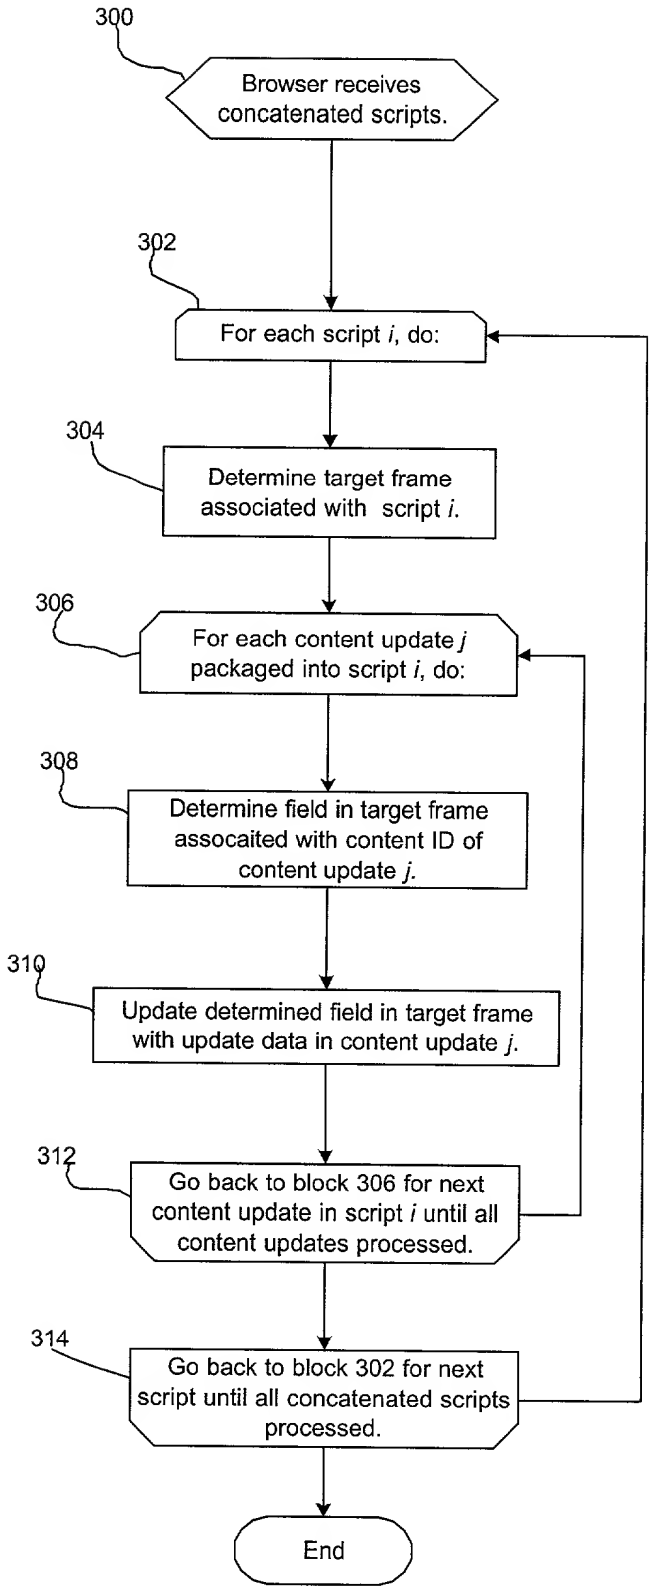
FIG. 9

FIG. 10



250
Receive periodic refresh GET request from browser to update servlet
252
Access update queue array for session object for requesting browser.
254
For each queue having content update, generate a script to apply the content updates to the application pane in the frame associated with the queue.
256
Concatenate scripts into a file.
258
Send concatenated scripts to browser requesting refresh.

FIG. 11



300
Browser receives concatenated scripts.
302
For each script *i*, do:
304
Determine target frame associated with script *i*.
306
For each content update *j* packaged into script *i*, do:
308
Determine field in target frame assocaited with content ID of content update *j*.
310
Update determined field in target frame with update data in content update *j*.
312
Go back to block 306 for next content update in script *i* until all content updates processed.
314
Go back to block 302 for next script until all concatenated scripts processed.
End
